2 alterMean-method

Umpire-package	UMPIRE: Ultimate Microarray Prediction, Inference, and Reality En-
	gine

## **Description**

A suite of microarray simulation software which includes additive and multiplicative noise, mixture of expressed and unexpressed genes, and uses statistical distributions to capture differences in mean expression and in standard deviation both within groups and between groups of samples. Finally, it incorporates a simple block correlation structure between genes.

#### **Details**

Package: Umpire
Type: Package
Version: 1.2.3
Date: 2011-12-01
License: Artistic-2.0
LazyLoad: yes

For a complete list of functions, use library(help = 'Umpire').

alterMean-method	Methods "alterMean" and "alterSD"

## **Description**

alterMean and alterSD are generic functions used to alter means or standard deviations respectively based on the input object. probability based on the input object. Each method invokes particular methods which depend on the class of the first argument.

#### Usage

```
## S4 method for signature 'ANY'
alterMean(object, TRANSFORM, ...)
## S4 method for signature 'ANY'
alterSD(object, TRANSFORM, ...)
```

## **Arguments**

object an object for which altering mean or standard deviation is desired

TRANSFORM function that returns its transformed input

... additional arguments affecting the specific transformation performed

#### Value

The form of the value returned by alterMean or alterSD depends on the class of its argument. See the documentation of the particular methods for details of what is produced by that method.

## Author(s)

P. Roebuck proebuck@mdanderson.org>

```
BlockHyperParameters-class
```

The "BlockHyperParameters" Class

## **Description**

Provides tools to create a CancerEngine with block correlation structure. Also makes it possible to simulate paired clinical and gene expression data with this block structure.

#### Usage

## **Arguments**

cm object of class CancerModel

hyperp object of class BlockHypeParameters

nExtraBlocks integer scalar specifying number of blocks not involved in the "hit" structure

defined by the CancerModel

meanBlockSize numeric scalar specifying mean number of genes in a correlated block

sigmaBlockSize numeric scalar specifying standard deviation of the number of genes in a corre-

lated block

minBlockSize integer scalar specifying minimal number of genes in a correlated block

mu0 numeric scalar specifying expected mean expression level of a gene on the log

scale

sigma0	numeric scalar specifying standard deviation of the mean expression level of a gene on the log scale
rate	numeric scalar specifying one of the gamma parameters
shape	numeric scalar specifying one of the gamma parameters
p.cor	numeric scalar specifying expected correlation within each block
wt.cor	numeric scalar specifying weight given to the expected block correlation
xform	A function that will be passed to the alterMean method
	extra arguments that wil be passed back to the xform function

#### **Details**

Our standard model for gene expression in a homogeneous sample assumes that the overall correlation matrix is block diagonal. Correlation between genes in different blocks is assumed to be zero. Correlation for genes in the same block is assumed to be a constant, but different correlation constants can be used in different blocks. The actual correlations are assumed to arise from a beta distribution of the form Beta(pw, (1-p)w), where p=p.cor and w=wt.cor are two of the hyperparameters.

The number of blocks is determined jointly by the CancerModel, cm, and the hyperparameter nExtraBlocks. The size of a block is assumed to arise from a normal distribution with mean given by meanBlockSize and standard deviaion given by sigmaBlockSize. To avoid accidentally assigning non-postive block sizes, this distribution is truncated below by minBlockSize.

The expression of each gene is assumed to come from a log-nor,mal distribution with parameters describing the per-gene mean  $(\mu_g)$  and standard deviation  $(\sigma_g)$  n the log scale. These parameters, in turn, are assumed to come from hyperdistributions. Specifically, we assume that  $\mu_g$  comes from a normal distribution with mean mu0 and standard deviation sigma0. We also assume that  $\sigma_g$  comes from an inverse gamma distribution with parameters rate and shape.

The BlockHyperParameters class simpy bundles the parameters for this model into a single structure. The default values are consistent with data we have seen from several Affymetrix microarray studies.

The makeBlockStructure function takes a CancerModel and a BlockHyperParameters object as arguments and produces a CancerEngine object. The rand method for this class can be used to generate matched clinical data (with the structure defined by the CancerModel object) and gene expression data with the specified block correlation structure.

#### Value

The BlockHyperParameters generator returns an object of class BlockHyperParameters.

The function makeBlockStructure returns an object of the CancerEngine class.

# **Objects from the Class**

Although objects of the class can be created by a direct call to new, the preferred method is to use the BlockHyperParameters generator function.

#### **Slots**

nExtraBlocks: An integer; the number of blocks not involved in the "hit" structure defined by the CancerModel.

meanBlockSize: A real number; the mean number of genes in a correlated block.

blur-method 5

sigmaBlockSize: A real number; standard deviation of the number of genes in a correlated block. minBlockSize: An integer; the minimal number of genes in a correlated block.

mu0: A real number; the expected mean expression level of a gene on the log scale.

sigma0: A real number; the standard deviation of the mean expression level of a gene on the log scale.

rate: Gamma parameter; see details.

shape: Gamma parameter; see details.

p.cor: A real number; the expected correlation within each block.

wt.cor: A real number; the weight given to the expected block correlation.

#### Methods

There are no special methods defind for this class.

# Examples

blur-method

Method "blur"

## Description

blur is a generic function used to add noise to a signal as defined by various objects. The method invokes particular methods which depend on the class of the first argument.

# Usage

```
## S4 method for signature 'ANY'
blur(object, x, ...)
```

6 CancerEngine-class

## **Arguments**

object an object from which adding noise to its signal is desired

x matrix containing signal to be affected

. . . additional arguments affecting the noise addition

#### Value

The form of the value returned by blur depends on the class of its argument. See the documentation of the particular methods for details of what is produced by that method.

CancerEngine-class The "CancerEngine" Class

# Description

A CancerEngine combines a CancerModel (which defines the combinatorics of hits that produce cancer subtypes) with a pair of gene expression Engines that can be used to simulate microarray data depending on the presence or absence of different hits.

# Usage

```
CancerEngine(cm, base, altered)
## S4 method for signature 'CancerEngine'
summary(object, ...)
```

## **Arguments**

cm object of class CancerModel

base character string giving the name of an Engine or EngineWithActivity, or an

object of class Engine. Represents the expected gene expression in the absence

of any hits.

altered character string giving the name of an Engine or EngineWithActivity, or an

object of class Engine. Represents the expected gene expression in the presence

of hits.

object of class CancerEngine

... extra arguments for generic routines

# **Objects from the Class**

Although objects of the class can be created by a direct call to new, the preferred method is to use the CancerEngine generator function.

CancerEngine-class 7

#### **Slots**

```
cm: A CancerModel object.
```

base: Object of class "character" giving the name of an Engine or EngineWithActivity. Represents the expected gene expression in the absence of any hits.

altered: Object of class "character" giving the name of an Engine or EngineWithActivity. Represents the expected gene expression in the presence of hits.

localenv: Object of class "environment"; used in the internal implementation.

#### Methods

```
rand signature(object = "CancerEngine"): :TODO:
summary signature(object = "CancerEngine"): :TODO:
```

CancerModel-class

The "CancerModel" Class

# Description

A CancerModel object contains a number of pieces of information representing an abstract, heterogeneous collection of cancer patients. It can be used to simulate patient outcome data linked to hit classes.

## Usage

```
CancerModel(name,
            nPossible,
            nPattern,
            HIT = function(n) 5,
            SURV = function(n) rnorm(n, 0, 2),
            OUT = function(n) rnorm(n, 0, 2),
            survivalModel=NULL,
            prevalence=NULL)
nPatterns(object)
nPossibleHits(object)
nHitsPerPattern(object)
outcomeCoefficients(object)
survivalCoefficients(object)
## S4 method for signature 'CancerModel'
ncol(x)
## S4 method for signature 'CancerModel'
nrow(x)
```

CancerModel-class 9

```
## $4 method for signature 'CancerModel'
rand(object, n, balance=FALSE, ...)
## $4 method for signature 'CancerModel'
summary(object, ...)
```

#### **Arguments**

name character string specifying name given to this model

object, x object of class CancerModel

nPossible integer scalar specifying number of potential hits relevant to the kind of cancer

being modeled

nPattern integer scalar specifying number of different cancer subtypes

HIT function that generates non-negative integers from a discrete distribution. Used

to determine the number of hits actually present in each cancer subtype.

SURV function that generates real numbers from a continuous distributions. Used in

simulations to select the coefficients associated with each hit in Cox proportional

hazards models.

OUT function that generates real numbers from a continuous distributions. Used in

simulations to select the coefficients associated with each hit in logistic models

of a binary outcome.

survivalModel object of class SurvivalModel used to simulate survival times for each simu-

lated patient

prevalence optional numeric vector of relative prevalences of cancer subtypes

n numeric scalar specifying quantity of random numbersbalance logical scalar specifying how patients should be simulated

... extra arguments for generic routines

## Details

The rand method is the most important method for objects of this class. It returns a data frame with four columns: the CancerSubType (as an integer that indexes into the hitPattern slot of the object), a binary Outcome that takes on values "Bad" or "Good", an LFU column with censored survival times, and a logical Event column that describes whether the simulated survival event has occurred.

The rand method for the CancerModel class adds an extra logical parameter, balanced, to the signature specified by the default method. If balanced=FALSE (the default), then patients are simulated based on the prevalence defined as apart of the model. If balanced=TRUE, then patients are simulated with equal numbers in each hit pattern class, ordered by the hit pattern class.

# Value

The CancerModel function is used to contruct and return an object of the CancerModel class.

The ncol and nrow functions return integers with the size of the matrix of hit patterns.

The rand method returns data frame with four columns:

CancerSubType integer index into object's 'hitPattern' slot outcome with values "Bad" or "Good"

LFU censored survival times

Event has simulated survival event has occurred?

10 CancerModel-class

#### **Objects from the Class**

Although objects of the class can be created by a direct call to new, the preferred method is to use the CancerModel generator function.

#### **Slots**

```
name: Object of class "character"
hitPattern: Object of class "matrix"
survivalBeta: Object of class "numeric" containing the coefficients associated with each hit in a Cox proportional hazards model of survival.
outcomeBeta: Object of class "numeric" containing the coefficients associated with each hit in a logistic model to predict a binary outcome.
prevalence: Object of class "numeric" containing the prevalence of each cancer subtype.
survivalModel: Object of class "survivalModel" containing parameters used to simualte survival times.
```

## Methods

```
ncol signature(x = "CancerModel"): ...
nrow signature(x = "CancerModel"): ...
rand signature(object = "CancerModel"): ...
summary signature(object = "CancerModel"): ...
```

SurvivalModel

Engine-class 11

|--|

#### **Description**

The Engine class is a tool (i.e., an algorithm) used to simulate vectors of gene expression from some underlying distribution.

## Usage

```
Engine(components)
nComponents(object)
## S4 method for signature 'Engine'
alterMean(object, TRANSFORM, ...)
## S4 method for signature 'Engine'
alterSD(object, TRANSFORM, ...)
## S4 method for signature 'Engine'
nrow(x)
## S4 method for signature 'Engine'
rand(object, n, ...)
## S4 method for signature 'Engine'
summary(object, ...)
```

#### **Arguments**

components	object of class list, each element of which contains the parameters for the underlying distribution that the gene expression follows. A component can be viewed as a special case of an engine that only has one component.
object, x	object of class Engine
TRANSFORM	function takes as its input a vector of mean expression or standard deviation and returns a transformed vector that can be used to alter the appropriate slot of the object.
n	numeric scalar representing number of samples to be simulated
	extra arguments for generic or plotting routines

## **Details**

In most cases, an engine object is an instantiation of a more general family or class that we call an ABSTRACT ENGINE. Every abstract engine is an ordered list of components, which can also be thought of as an engine with parameters. We instantiate an engine by binding all the free parameters of an abstract engine to actual values. Note that partial binding (of a subset of the free parameters) produces another abstract engine.

For all practical purposes, a COMPONENT should be viewed as an irreducible abstract engine. Every component must have an IDENTIFIER that is unique within the context of its enclosing abstract engine. The identifer may be implicitly taken to be the position of the component in the ordered list.

We interpret an Engine as the gene expression generator for a homogenous population; effects of cancer on gene expression are modeled at a higher level.

12 Engine-class

#### Value

The Engine generator returns an object of class Engine.

The alterMean method returns an object of class Engine with altered mean.

The alterSD method returns an object of class Engine with altered standard deviation.

The nrow method returns the number of genes (i.e, the length of the vector) the Engine object will generate.

The rand method returns nrow(Engine)\*n matrix representing the expressions of nrow(Engine) genes and n samples.

The summary method prints out the number of components included in the Engine object.

The nComponents method returns the number of components in the Engine object.

## **Objects from the Class**

Objects can be created by calls of the form new("Engine", components=components), or use the Engine generator function. Every engine is an ordered list of components, which generates a contiguous subvector of the total vector of gene expression.

#### Methods

**alterMean(object, TRANSFORM,...)** Takes an object of class Engine, loops over the components in the Engine, alters the mean as defined by TRANSFORM function, and returns a modified object of class Engine.

**alterSD(object, TRANSFORM,...)** Takes an object of class Engine, loops over the components in the Engine, alters the standard deviation as defined by TRANSFORM function, and returns a modified object of class Engine.

**nrow**(x) Counts the total number of genes (i.e, the length of the vector the Engine will generate).

**rand(object, n, ...)** Generates nrow(Engine) \* n matrix representing gene expressions of n samples following the underlying distribution captured in the object of Engine.

summary(object,...) Prints out the number of components included in the object of Engine.

EngineWithActivity-class

The "EngineWithActivity" Class

# Description

The EngineWithActivity is used to set some components in the object of class Engine to be transcriptionally inactive and transform the expression data to appropriate logarithmic scale.

# Usage

```
EngineWithActivity(active, components, base=2)
## S4 method for signature 'EngineWithActivity'
rand(object, n, ...)
## S4 method for signature 'EngineWithActivity'
summary(object, ...)
```

## **Arguments**

active	logical vector with length equal to number of components specifying whether each component should be transcriptionally active, or a numeric scalar specifying the probability for a component to be active
components	list where each element contains the parameters for the underlying distribution that the gene expression follows
base	numeric scalar specifying the logarithmic scale to which the data should be transformed
object	object of class EngineWithActivity
n	number of samples to be simulated
	extra arguments for generic routines

#### **Details**

An ENGINE WITH ACTIVITY allows for the possibility that some components (or genes) in an expression engine (or tissue) might be transcriptionally inactive. Thus, the true biological signal S\_gi should really be viewed as a mixture:

$$S_q i = z_q * delta_0 + (1 - z_q) * T_q i$$

where delta\_0 = a point mass at zero;  $T_gi = a$  random variable supported on the positive real line;  $z_g \sim Binom(pi)$  defines the activity state (1 = on, 0 = off)

The rand method for an EngineWithActivity is a little bit tricky, since we do two things at once. First, we use the base slot to exponentiate the random variables generated by the underlying Engine on the log scale. We treat base =  $\emptyset$  as a special case, which means that we should continue to work on the scale of the Engine. Second, we mask any inactive component by replacing the generated values with  $\emptyset$ .

Note that this is terribly inefficient if we only have a single homogeneous population, since we generate a certain amount of data only to throw it away. The power comes when we allow cancer disregulation to turn a block on or off, when the underlying data reappears.

#### Value

The EngineWithActivity generator returns an object of class EngineWithActivity.

The rand method returns nrow(EngineWithActivity) \* n gene expression matrix with the inactive components being masked by  $\emptyset$ .

The summary method prints out the total number of components and the number of active components in the object of EngineWithActivity.

#### **Objects from the Class**

Although objects of the class can be created by a direct call to new, the preferred method is to use the EngineWithActivity generator function.

#### Slots

active: logical vector specifying whether each component should be transcriptionally active or not

base: numeric scalar specifying the logarithmic scale

components: list specifying the parameters of the underlying distribution

#### **Extends**

Class Engine, directly.

## Methods

rand(object, n, ...) Generates nrow(EngineWithActivity)\*n matrix representing gene expressions of n samples, and the transcriptionally inactive components are masked by 0.

**summary(object,...)** Prints out the total number of components and the number of active components in the object of EngineWithActivity.

#### **Examples**

IndependentLogNormal-class

The "IndependentLogNormal" Class

## **Description**

The IndependentLogNormal class is a tool used to generate gene expressions that follow log normal distribution, because the true expression value follows log normal in our model.

#### Usage

```
IndependentLogNormal(logmu,logsigma)
## S4 method for signature 'IndependentLogNormal'
nrow(x)
## S4 method for signature 'IndependentLogNormal'
rand(object, n, ...)
## S4 method for signature 'IndependentLogNormal'
summary(object, ...)
```

## **Arguments**

```
logmu numeric vector specifying the mean expression values on the logarithmic scale.

logsigma numeric vector specifying the standard deviation of the gene expression values on the logarithmic scale

object, x object of class IndependentLogNormal

n numeric scalar specifying number of samples to be simulated

extra arguments for generic or plotting routines
```

## **Objects from the Class**

Although objects of the class can be created by a direct call to new, the preferred method is to use the IndependentLogNormal generator function.

#### **Slots**

logmu: numeric vector containing the mean expression values on the logarithmic scale

logsigma: numeric vector containing the standard deviation of the gene expression values on the logarithmic scale

#### Methods

**nrow**(**x**) Returns the number of genes (i.e, the length of the logmu vector).

**rand(object, n, ...)** Generates nrow(IndependentLogNormal)\*n matrix representing gene expressions of n samples following log normal distribution captured in the object of IndependentLogNormal.

**summary(object,...)** Prints out the number of independent log normal random variables in the object of IndependentLogNormal.

```

IndependentNormal-class

The "IndependentNormal" Class

## **Description**

The IndependentNormal class is a tool used to generate gene expressions that follow independent normal distribution.

## Usage

```
IndependentNormal(mu,sigma)
## S4 method for signature 'IndependentNormal'
alterMean(object, TRANSFORM, ...)
## S4 method for signature 'IndependentNormal'
alterSD(object, TRANSFORM, ...)
## S4 method for signature 'IndependentNormal'
nrow(x)
## S4 method for signature 'IndependentNormal'
rand(object, n, ...)
## S4 method for signature 'IndependentNormal'
summary(object, ...)
```

#### **Arguments**

mu	numeric vector specifying the mean expression values
sigma	numeric vector specifying the standard deviation of the gene expression values
object, x	object of class IndependentNormal
TRANSFORM	function that takes a vector of mean expression or standard deviation and returns a transformed vector that can be used to alter the appropriate slot of the object.
n	numeric scalar specifying number of samples to be simulated
	extra arguments for generic or plotting routines

#### **Details**

Note that we typically work on expression value with its logarithm to some appropriate base. That is, the independent normal should be used on the logarithmic scale in order to construct the engine.

# **Objects from the Class**

Objects can be created by using the IndependentNormal generator function. The object of class IndependentNormal contains the mean and standard deviation for the normal distribution

#### **Slots**

```
mu: see corresponding argument above sigma: see corresponding argument above
```

#### Methods

- **alterMean(object, TRANSFORM,...)** Takes an object of class IndependentNormal, loops over the mu slot, alters the mean as defined by TRANSFORM function, and returns an object of class IndependentNormal with altered mu.
- **alterSD**(**object**, **TRANSFORM**, ...) Takes an object of class IndependentNormal, loops over the sigma slot, alters the standard deviation as defined by TRANSFORM function, and returns an object of class IndependentNormal with altered sigma.
- **nrow**(**x**) Returns the number of genes (i.e, the length of the mu vector).
- **rand(object, n, ...)** Generates nrow(IndependentNormal)\*n matrix representing gene expressions of n samples following the normal distribution captured in the object of IndependentNormal.
- **summary(object,...)** Prints out the number of independent normal random variables in the object of IndependentNormal.

MVN-class 19

## **Description**

The MVN class is a tool used to generate gene expressions that follow multivariate normal distribution.

## Usage

```
MVN(mu, Sigma, tol = 1e-06)
covar(object)
correl(object)
## S4 method for signature 'MVN'
alterMean(object, TRANSFORM, ...)
## S4 method for signature 'MVN'
alterSD(object, TRANSFORM, ...)
## S4 method for signature 'MVN'
nrow(x)
## S4 method for signature 'MVN'
rand(object, n, ...)
## S4 method for signature 'MVN'
summary(object, ...)
```

## **Arguments**

mu	numeric vector representing k-dimensional means
Sigma	numeric $k$ -by- $k$ covariance matrix containing the measurement of the linear coupling between every pair of random vectors
tol	numeric scalar roundoff error that will be tolerated when assessing the singularity of the covariance matrix
object, x	object of class MVN
TRANSFORM	function that takes a vector of mean expression or standard deviation and returns a transformed vector that can be used to alter the appropriate slot of the object.
n	numeric scalar representing number of samples to be simulated
	extra arguments for generic or plotting routines

# Details

The implementation of MVN class is designed for efficiency when generating new samples, since we expect to do this several times. Basically, this class separates the mvrnorm function from the **MASS** package into several steps. The computationally expensive step (when the dimension is large) is the eigenvector decomposition of the covariance matrix. This step is performed at construction and the pieces are stored in the object. The rand method for MVN objects contains the second half of the mvrnorm function.

Note that we typically work on expression value with its logarithm to some appropriate base. That is, the multivariate normal should be used on the logarithmic scale in order to contruct engine.

alterMean for an MVN simply replaces the appropriate slot by the transformed vector. alterSD for an MVN is trickier, because of the way the data is stored. In order to have some hope of getting this

20 MVN-class

correct, we work in the space of the covariance matrix, Sigma. If we let R denote the correlation matrix and let Delta be the diagonal matrix whose entries are the individual standard deviations, then Sigma = Delta% \* %R% \* %Delta. So, we can change the standard deviations by replacing Delta in this product. We then construct a new MVN object with the old mean vector and the new covariance matrix.

covar and correl functions calculate the covariance matrix and correlation matrix underlies the covariance matrix for the objects of class MVN, respectively. We have four assertions as shown below, and will be tested in the examples section:

- covar should return the same matrix that was used in the function call to construct the MVN object.
- 2. After applying an alterMean method, the covariance matrix is unchanged.
- 3. The diagonal of correlation matrix consists of all ones.
- 4. After applying an alterMean or an alterSD method, the correlation matrix is unchanged.

#### **Objects from the Class**

Although objects of the class can be created by a direct call to new, the preferred method is to use the MVN generator function.

#### **Slots**

mu: numeric vector containing the k-dimentional means

lambda: numeric vector containing the square roots of eigenvalues of the covariance matrix

half: numeric matrix with k\*k dimensions whose columns contain the eigenvectors of the covariance matrix

#### Methods

**alterMean(object, TRANSFORM,...)** Takes an object of class MVN, loops over the mu slot, alters the mean as defined by TRANSFORM function, and returns an object of class MVN with altered mu.

**alterSD(object, TRANSFORM,...)** Takes an object of class MVN, works on the diagonal matrix of the covariance matrix, alters the standard deviation as defined by TRANSFORM function, and reconstructs an object of class MVN with the old mu and reconstructed covariance matrix.

 $\mathbf{nrow}(\mathbf{x})$  Returns the number of genes (i.e, the length of the mu vector).

**rand(object, n, ...)** Generates nrow(MVN) \* n matrix representing gene expressions of n samples following the multivariate normal distribution captured in the object of MVN.

**summary(object,...)** Prints out the number of multivariate normal random variables in the object of MVN.

covar(object) Returns the covariance matrix of the object of class MVN.

correl(object) Returns the correlation matrix of the object of class MVN.

#### **Examples**

```
showClass("MVN")
  ## Not run:
tolerance <- 1e-10
## Create a random orthogonal 2x2 matrix
a <- runif(1)
b <- sqrt(1-a^2)
X \leftarrow matrix(c(a, b, -b, a), 2, 2)
## Now choose random positive squared-eigenvalues
Lambda2 <- diag(rev(sort(rexp(2))), 2)</pre>
## Construct a covariance matrix
Y \leftarrow t(X)
## Use the MVN constructor
marvin <- MVN(c(0,0), Y)
## Check the four assertions
print(paste('Tolerance for assertion checking:', tolerance))
print(paste('Covar assertion 1:',
            all(abs(covar(marvin) - Y) < tolerance)))</pre>
mar2 <- alterMean(marvin, normalOffset, delta=3)</pre>
print(paste('Covar assertion 2:',
            all(abs(covar(marvin) - covar(mar2)) < tolerance)))</pre>
print(paste('Correl assertion 1:',
            all(abs(diag(correl(marvin)) - 1) < tolerance)))</pre>
mar3 <- alterSD(marvin, function(x) 2*x)</pre>
print(paste('Correl assertion 1:',
            all(abs(correl(marvin) - correl(mar2)) < tolerance)))</pre>
rm(a, b, X, Lambda2, Y, marvin, mar2, mar3)
## End(Not run)
```

NoiseModel-class

The "NoiseModel" Class

## **Description**

A NoiseModel represents the additional machine noise that is layered on top of any biological variabilty when measuring the gene expression in a set of samples.

## Usage

```
NoiseModel(nu, tau, phi)
## S4 method for signature 'NoiseModel'
blur(object, x, ...)
```

## **Arguments**

nu The mean value for the additive noise

tau The standard deviation for the additive noise

22 NoiseModel-class

phi	The standard deviation for the multiplicative noise. Note the mean of multiplicative noise is set to $\emptyset$ .
object	object of class NoiseModel
x	The data matrix containing true signal from the gene expression
	extra arguments affecting blur applied

#### **Details**

We model both additive and multiplicative noise, so that the observed expression of gene g in sample i is given by:  $Y_g i = S_g i exp(H_g i) + E_g i$ , where  $Y_g i$  = observed expression,  $S_g i$  = true bilogical signal,  $H_g i \sim N(0, phi)$  defines the multiplicative noise, and  $E_g i \sim N(nu, tau)$  defines the additive noise. Note that we allow a systematic offset/bias in the additive noise model.

#### Methods

**blur(object, x,...)** Adds and multiplies random noise to the data matrix x containing the true signal from the gene expression.

NormalVsCancer 23

NormalVsCancer Simulating Cancer Versus Normal Datasets
---

## **Description**

These functions are useful for simulating data that compares a homogeneous "cancer" group to a homogeneous "normal" group of samples.

# Usage

```
NormalVsCancerModel(nBlocks, survivalModel=NULL, name="NormalVsCancer") NormalVsCancerEngine(nBlocks, hyperp)
```

# **Arguments**

nBlocks scalar integer representing number of correlated blocks that are differentially

expressed between cancer and normal

survivalModel a SurvivalModel object

name character string specifying name of the object being created

hyperp object of class BlockHyperParameters that describes the block correlation struc-

ture.

# **Details**

The simplest simulation model assumes that we are comparing two homogeneous groups.

24 SurvivalModel-class

	rand-method	Method "rand"
--	-------------	---------------

# Description

rand is a generic function used to produce random numbers from the distribution defined by various objects. The method invokes particular methods which depend on the class of the first argument.

## Usage

```
## S4 method for signature 'ANY'
rand(object, n, ...)
```

## **Arguments**

object an object from which random numbers from a distribution is desired numeric scalar specifying quantity of random numbers additional arguments affecting the random numbers produced

#### Value

The form of the value returned by rand depends on the class of its argument. See the documentation of the particular methods for details of what is produced by that method.

# Author(s)

Kevin R. Coombes <a href="mailto:krc@silicovore.com">krc@silicovore.com</a>>, P. Roebuck <a href="mailto:krc@silicovore.com">proebuck@mdanderson.org</a>>

```
SurvivalModel-class The "SurvivalModel" Class
```

## **Description**

A Survival Model class represents the information for simulating survival times for each patient.

# Usage

SurvivalModel-class 25

#### **Arguments**

baseHazard numeric scalar describing the underlying hazard rate at baseline levels of covari-

ates

accrual numeric scalar representing number of patient accrual years

followUp numeric scalar representing frequency of follow up in the unit of year

units numeric scalar representing number of units per year where units are specified

by unitName

unitName character string representing the unit argument type

object of class SurvivalModel

n numeric scalar specifying quantity of random numbers beta numeric vector specifying beta parameters for patients

... extra arguments for generic routines

#### Value

The SurvivalModel generator returns an object of class SurvivalModel.

The rand method returns a data.frame with components:

LFU time to event

Event whether the data is censored

#### **Objects from the Class**

Although objects of the class can be created by a direct call to new, the preferred method is to use the SurvivalModel generator function.

## Slots

baseHazard: see corresponding argument above accrual: see corresponding argument above followUp: see corresponding argument above units: see corresponding argument above unitName: see corresponding argument above

#### Methods

rand(object, n, beta, ...) Simulate survival data for n patients given beta.

beta <- rep(rnorm(5, 0, 2), each=20)
outcome <- rand(sm, 100, beta=beta)
summary(outcome)</pre>
```

transforms

Transform functions

## Description

normalOffset is a function that can be used as the TRANSFORM argument in an alterMean operation, which adds an offset to each value in the mean where the offset is chosen from a normal distribution.

invGammaMultiple is a function that can be used as the TRANSFORM argument in an alterSD operation, which multiplies each standard deviation by a positive value chosen from an inverse gamma distribution with parameters shape and scale.

## Usage

```
normalOffset(x, delta, sigma)
invGammaMultiple(x, shape, rate)
```

# **Arguments**

X	numeric vector of mean expression or standard deviation defined in the object
delta, sigma	numeric vector used as mean and/or sd parameters specifying the normal distribution $% \left( \frac{1}{2}\right) =\frac{1}{2}\left( $
shape, rate	numeric vector used as shape and/or rate parameters specifying the gamma distribution. Must be positive.
•••	additional arguments affecting the specific transformation performed

# Value

normalOffset returns a new vector, each element of which is added by a offset chosen from a normal distribution with parameters mean and sd.

invGammaMultiple returns a new vector, each element of which is multiplied by a positive value chosen from an inverse gamma distribution with parameters shape and scale.
